

ORAL ANTIBIOTICS: OCULAR INDICATIONS

- Beat the bugs!
- Rosacea / Ocular Rosacea
- Dacryoadenitis
- Dacryocystitis
- Preseptal Cellulitis
- Hordeola / Chalazia
- Blowout Fractures

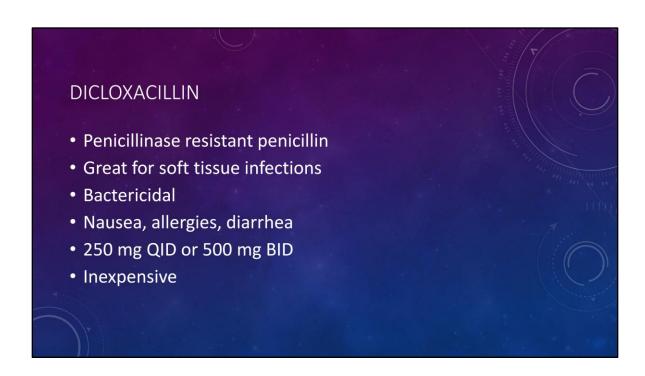

COST

- \$4 (30 day) and \$10 (90 day) lists for generics at Kroger, Walmart, Target etc.
- Indicated by an *
- Meijer has some generic antibiotics for free (Cipro, Cephalexin, Amoxicillin, PCN-VK, Ampicillin, SMZ-TMP)

CEPHALEXIN * • 250 or 500 mg (QID or BID) • Excellent broad spectrum cephalosporin • Bactericidal • Cross sensitivity with penicillin regarding allergies but not with everyone • Keflex brand is very expensive! • Up to 40% failure rate with facial cellulitis due to resistance

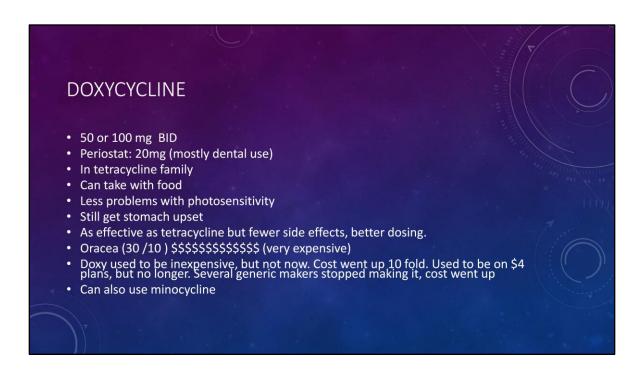

AUGMENTIN

- Amoxicillin plus clavulanate: 250,500 mg TID or 875mg
 BID
- Works on bugs that are resistant to penicillin due to penicillinase
- Bactericidal, good coverage, allergies
- 500mg now available generically, but more expensive than dicloxacillin

TETRACYCLINE*

- 250 or 500 mg QID
- · Bacteriostatic but much resistance
- Poor for soft tissue disease
- Can not be used in pregnant women or children due to effect on bone and enamel formation (discoloration of teeth)
- Makes BC Pill less effective. Yeast infections.
- Photosensitivity, stomach upset, calcium inactivation (take on empty stomach)
- Great lipid / acid modulating effects

AZITHROMYCIN

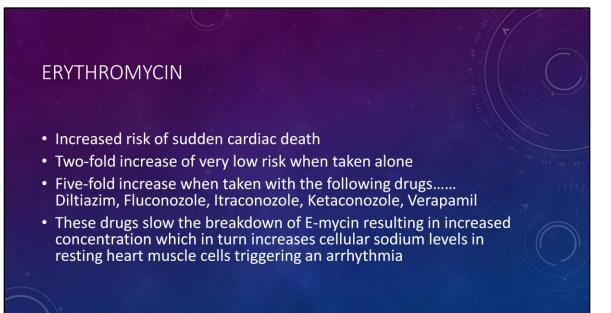

- Zithromax Z-pack: 6, 250 mg capsules. Is a macrolide.
 Moderate price
- Take 500 mg (2) the first day and one 250 mg tablet each of the next 4 days
- Can also take a single, 1000 mg dose (for chlamydia for example)
- May enhance the effect of oral anticoagulants
- Expensive but great for compliance
- 2 X risk of sudden cardiac death in heart patients

AZITHROMYCIN

- Now has FDA warning for fatal arrhythmia
- Greater risk if prolonged QT interval, bradycardia, hypomagnesia. Some studies refute this risk, so contoversial
- Many experts calling for ban due to resistance concerns.
 Long half life and broad spectrum contribute majorly to overall resistance.
- Can be as effective in treating rosacea / MGD / chalazia as the tetracycline / doxycline family of drugs

ERYTHROMYCIN*

- Ery-tab sustained release tablets 250, 333, or 500 mg. Dose is 1000 mg (1 gram) per day so dose according to tablet
- Can use safely when tetracycline family can not be used (children, etc.)
- Bacteriostatic and terrible stomach upset
- Dose not have the lipid / acid modulating properties of the tetracyclines
- Never a first choice

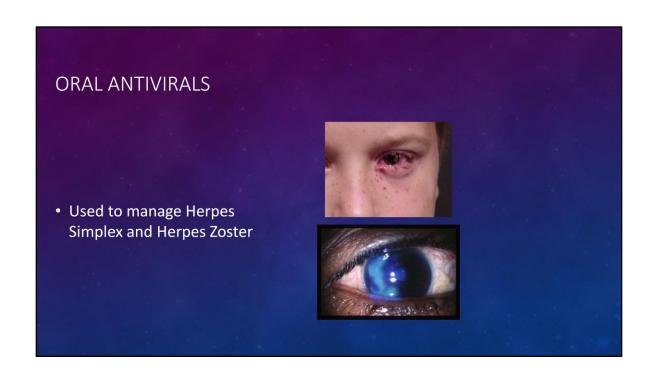

BACTRIM

- Trimethoprim and Sulfamethoxazole: one tablet contains 80 mg T and 400 mg S (also available in double strength).
 One double-strength tablet Q12h
- Can not use if patient has sulfa allergy
- Good against MRSA and toxoplasmosis

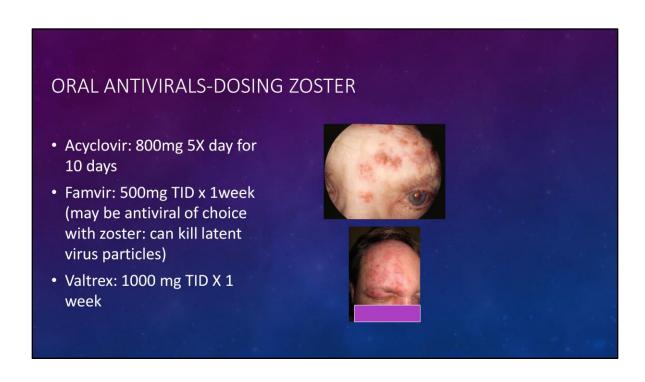

CIPROFLOXACIN*

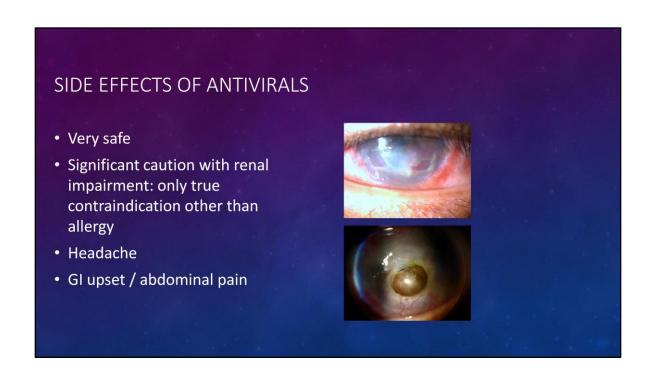

- Fluoroquinolone: 750 / 500 / 250 BID
- 5mg/100ml suspension
- Effective but overused so resistance an issue. Lavaquin shows less resistance
- Can not use in patients under 18 due to joint / tendon problems
- Possible increased risk of RD? 3% vs. .6%. Other large studies refute this

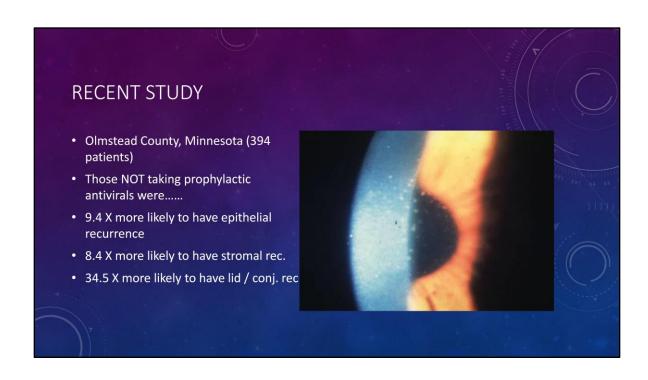

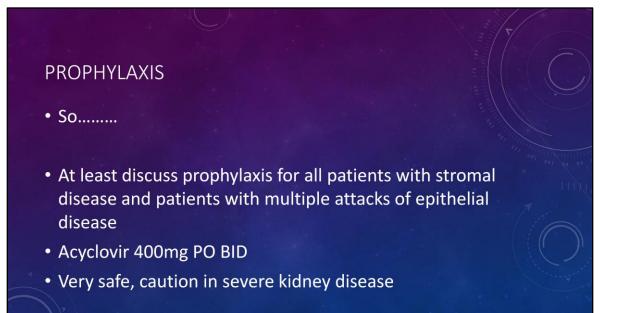

H.E.D.S. (HERPETIC EYE DISEASE STUDY) - FINDINGS

- Prophylactic 400 mg of oral Acyclovir (Famvir / Valtrex not studied) twice per day for one year resulted in a 45% decrease in the rate of recurrence for all forms of ocular complications
- Over the six months after discontinuation, there was no rebound increase but no continued benefit, so have to keep taking it
- Interestingly, the benefit mostly applied to those with previous stromal disease, not previous dendrites alone in this study

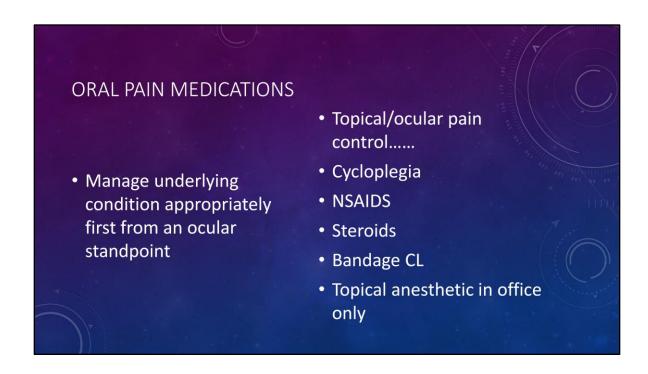

PROPHYLAXIS

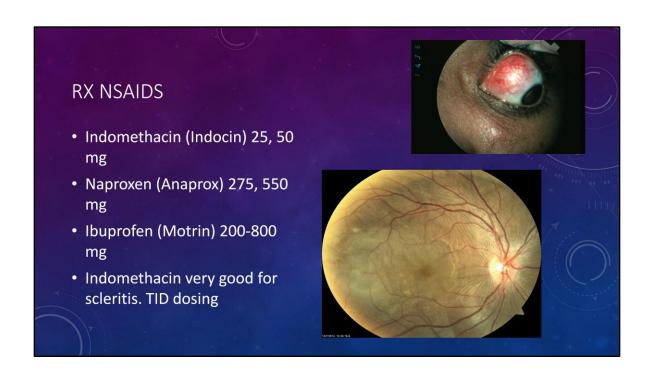

However: Report in Journal of Infectious Disease 2013:208 (November) 1359-1365 and an editorial in the same issue.....

- Are we creating Acyclovir resistant strains of HSV with prophylactic use?
- In cases using Acyclovir for ocular prophylaxis, 26% showed ACV resistance. So now we must consider this

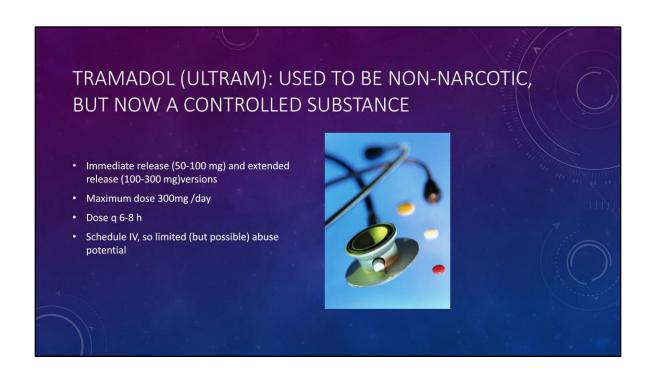

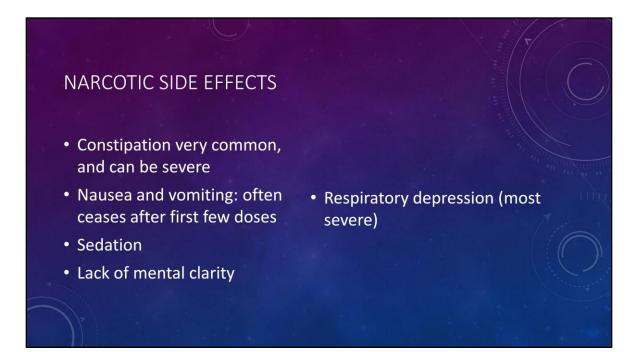

COMMON NSAID CONCERNS

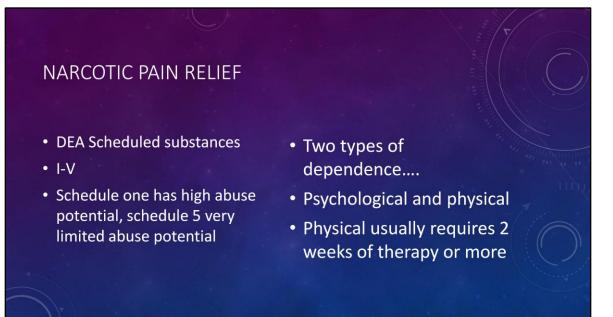

- GI upset (take with food or drink, don't lie down for 30 minutes)
- Bleeding
- Ulcers

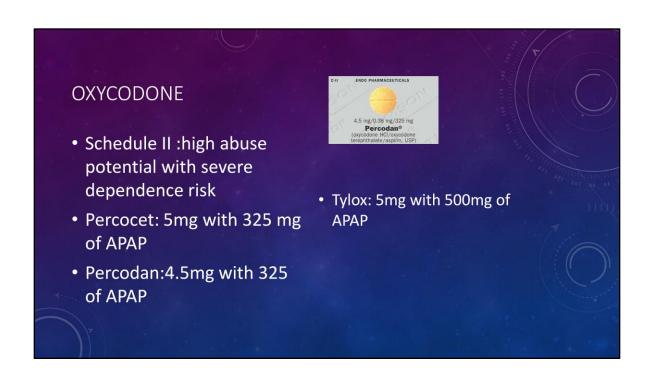

- Caution also with renal disease, heart disease, liver disease (mostly APAP)
- Rx strength particularly problematic with heart disease

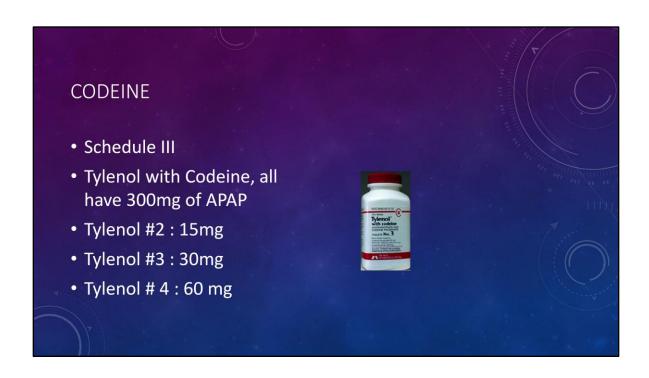

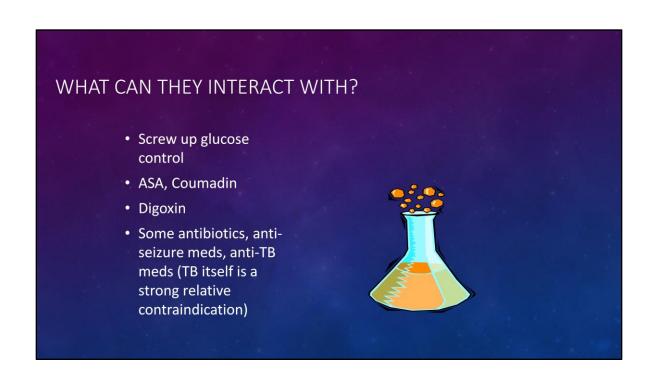

ORAL STEROIDS When oral steroids are used appropriately for a relatively short time they are very, very safe After all, they are basically a natural substance already found in the body Be aware of body weight when dosing

WHO DOESN'T GET ORALS, OR GETS THEM VERY, VERY CAREFULLY

- Diabetics
- Patients with stomach problems / ulcers
- Patients with active infection
- Pregnant women

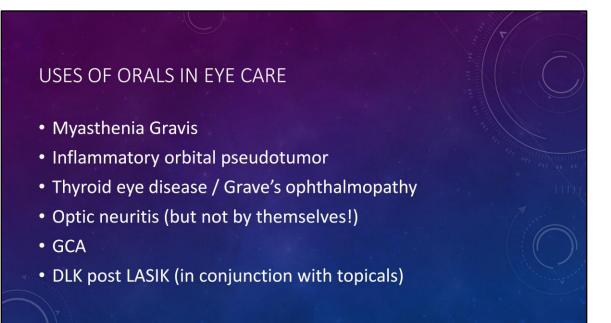

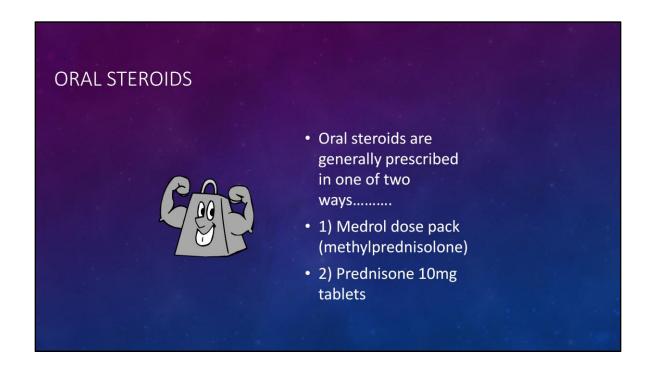

WHAT CAN WE USE ORAL STEROIDS FOR IN EYE CARE?

- Contact dermatitis / allergic response of the eye lids
- Reaction to insect bite or sting on the eye lids
- Recalcitrant CME
- Recalcitrant uveitis, especially bilateral or vitritis
- Choroiditis / retinitis
- Scleritis

OCULAR SIDE EFFECTS OF ORAL STEROIDS

- These are well known.....PSC's and increased IOP
- IOP increases are rare, but can occur with very long term use
- PSC's are not rare!
- 10 mg per day or less for one year or less has almost no chance of PSC formation
- 16 mg per day or more for several years has a 75% chance of PSC formation
- Overall, general population has a .5% chance of PSC development while those on long term oral steroids have a 30% prevalence (across doses)

COMPARISONS

- When it comes to suppressing the HPA (hypothalamic-pituitaryadrenal) axis......
- 25mg Cortisone = 20mg Hydrocortisone = 5mg Prednisone = 4mg Triamcinolone = 4mg Methylprednisone = .75mg Dexamethasone
- Potency essentially follows this order but in reverse
- Body produces an amount of cortisone that equals 5mg of prednisone per day

MEDROL DOSE PACK

- Available in different strengths
- Most commonly used is a package of 21, 4 mg tablets(2 mg is available)
- Six are taken the first day, then one less each day thereafter (6-5-4-3-2-1 = 21 tablets)
- Self tapering and little to no suppression of the HPA axis
- In eye care, really only strong enough and long lasting enough for treatment of lid reactions

PREDNISONE*

- Most common dosing is to give the desired amount in 10 mg tablets (need 40 mg, take 4 pills)
- Is available in 1, 2.5, 5, 10, 20, and 50 mg tablets
- Best choice for most of our desired uses in eye care
- Potent and flexible

Up to 60 mg, take entire dose in the morning Over this amount take ½ in morning, ½ in evening As previously mentioned, Medrol dose pack self tapers With prednisone, after relatively short course at full desired strength (say 2-3 weeks or so), taper by ten milligrams every other day

DOSING

- An alternative approach is to give twice the desired dose every other day then don't taper. Only for short term use
- Theory is that anti-inflammatory properties remain high but suppression of HPA axis is much, much less
- For long term use taper must be very slow
- As OD's we rarely would be involved in the long term prescription of oral steroids
